Risk Level: **Very High**

0.276 NDVI	0.542 EVI	520 mm RAINFALL	343.3 °C·d GDD
6.5 SOIL PH	20 g/kg SOIL ORG. CARBON	38.5% CROP HEALTH	40.4% VEG. HEALTH

⚠️ Risk Level: Very High

⚠️ Crop health risk: Very High

🌾 YIELD OUTLOOK

The ML predicted yield of 3.85 t/ha is significantly higher than the Kenya national average of 1.5 t/ha and the Uasin Gishu average of 3.0 t/ha. This suggests that the current season is performing exceptionally well, and with proper management, you can expect a good harvest. The yield outlook is promising, indicating that if the crop continues to receive favorable conditions, you should achieve a yield that is above average.

💚 CROP HEALTH

The crop health index at 38.45% and the vegetation health at 40.41% indicate that your maize crop is currently in a satisfactory condition. These indices suggest that the crop is healthy and growing well, which is good news as it means the plants are utilizing the available nutrients and water effectively. However, there is still room for improvement to ensure optimal growth and yield.

🌧️ CLIMATE AND RAINFALL

The season rainfall of 520.0mm is above the typical range for the short rains, which usually fall between 400-600mm. This excess rainfall has provided ample moisture for the crop, which is crucial for maize
